"Scientific Discussion on the Problems of the Postwar Economics of Capitalism," I. M. Mikheyev, 12 pp

"Iz Ak Nauk Otdel Ekon i Prava" No 4

Describes discussion of Academician Ye. S. Varga's book, "Changes in the Economics of Capitalism as a Result of World War II." Twenty participants included academicians, corresponding members of the Academy, doctors and professors. Author of article quotes opinions, both favorable and unfavorable, expressed by the 20 participants. Varga states that, as the author of the book, he was satisfied with the discussion, which was carried on by qualified economists and sharp critics, but that as an economist, he was forced to disagree with certain basic questions brought up in the discussion. He agreed that the book had certain deficiencies, but upheld his basic premises even in the face of opposition. Meeting held under chairmanship of Corresponding Member K. V. Ostrovityanov.

Phosphatase activity of lung tissues in tuberculosis.
Céza Vargha (Univ. Budapest). *Kísérletes Orvostudomány*
2, 200-3 (1950). --Tissues were examd. not later than 10
hrs. after death by the Gomori method (C.1. 34, 402).
A difference was observed between alk. phosphatase activity
(at pH 9.2) of exudative pneumonic forms, the specific ele-
ments of tubercular granulation, and cheesy tissues (little
activity), and nonspecific granulation tissue (chiefly of
granulating cavern walls), alveolar epithelium in chronic in-
flammation, and alveolar exudate; the latter 3 showed high
activities. This is explained by an increased cell metabo-
lism. Acid phosphatase detns. at pH 4.7 and 5.0 gave no
evaluable results.

Description of a case of diffuse interstitial pulmonary fibrosis of unknown aetiology
with fatal ending morphologically identical with Hamman-Rich syndrome. Chief
symptoms were increasing dyspnoea, cyanosis, bouts of coughing with constant
absence of acid-fast bacilli, leading finally to heart failure. Treatment with ACTH
resulted in temporary improvement only. The aetiology, pathogenesis and treat-
ment are discussed.

1463. EFFECT OF PNEUMOPERITONEUM ON THE PHAGOCYTOSIS ENHANCING ACTION OF BLOOD SERUM - Vargha G., Vajda G. and Szabadi L. Tb Dept. II and Lab. of Sanat., Hungarian State Railways (MAV); Lab. of MAV Hosp., Budapest - DIS. CHEST 1959, 36/4 (392-396) Tables 2

The authors were interested to study whether the use of pneumoperitoneum (pnp) stimulates or inhibits the immunological reactions aimed at fighting off disease such as tb. Since one manifestation of systemic defence is the phagocytosis of bacteria by leucocytes, they studied this effect in the blood sera of 10 patients with pulmonary tb before and after pnp. They found that pnp increased the phagocytosis-enhancing effect of serum, and the number of circulating eosinophils decreased significantly. Also in the majority of cases leucocytosis, granulocytosis and lymphocytopenia could be demonstrated. They postulate that such changes may be due to a shift in the sympathetic direction in the tone of the vegetative nervous system, due presumably to an increased output of adrenaline and/or of cortisone.

TITLE: Patho-radiological aspects of the anastomosis of the resected stomach. Phantom experiments on the operated stomach of dogs

SOURCE: Magyar radiologia, no. 2, 1965, 78-87

TOPIC TAGS: gastroenterology, pathology, radiology, surgery, tumor, experiment animal, digestive system, digestive system disease, carcinoma

ABSTRACT:

The clinical symptoms in the operated stomach, which can be demonstrated by radiology, are discussed. Phantom experiments with paraffin and water were performed by the authors and mechanical changes were produced, which resembled pathological alterations (ulcers and tumors), in the anastomosis and in the resected stomach (Billroth II). The phantoms, run on dogs, were similar to the human abdomen. It was found that X-ray examinations are unsuitable for the detection of the superficial forms of marginal ulcer and gastroscopy must, therefore, be performed. Deeper and more extensive marginal ulcers can be detected successfully by X-ray examinations as well, however. Parietographic examinations are very useful for the detection of carcinoma in the anastomosis, especially in

"The Importance of the Use of a No-Spa and Isopropamide Combination (Espan in Tablet Form) in the Treatment of Ulcer."

Budapest, Orvosi Hetilap, Vol 107, No 38, 18 Sep 66, pages 1796-1800.

Abstract: [Author's Hungarian summary] The therapeutic use of a new, domestically produced drug, No-Spa-Isopropamidum, is reported in ulcer diseases. Good therapeutic effects were achieved in 80.1 per cent of the cases and recurrences were also reasonably low. The results were compared with those of other drugs used in the treatment of ulcer and the conclusion was reached that, of all domestically produced compounds tested, this gave the best results. The drug is considered to be also suitable for the ambulatory treatment of ulcer. 11 Hungarian, 5 Western references.

44. Chemical polishing in metallographical practice -- A vegyi csiszolas
 es fenyestites alkalmazasa metallografiai vizslatohoz -- by Gy. Varga.
 (Aluminium -- Vol. III, No. 6, pp. 127-132, 1958, 11 p.).

In the case of specimens which are welded and in
 similar cases, it was found necessary to increase locally a
 relatively large metal specimens. The preparation of
 these specimens by mechanical methods was rather clumsy. The chemical
 polishing process evolved in 1950 proved suitable for scratch-free polish-
 ing of metal specimens. A treatment of 3 to 6 minutes in a chemical
 polishing solution containing orthophosphoric acid, concentrated sulfuric
 acid and potassium sulfate led to satisfactory results provided the
 temperature is maintained between 65 and 70°C. This method
 can be used for aluminium specimens. Al

CA
Furan compounds. 1. Conversion of 2-acetylfuran to 4,5-dioxo-2-hexenal 1 acetal and pyrocatechol. 1. Var-gha, J. Ramonczai, and P. Bute (Univ. "Bolyai," Cluj-Ghaza, Rumana). J. Im. Chem. Soc. 70, 371-4 (1948); cf. C.A. 41, 6502a. 2-Acetylfuran oxime (30 g.) in 140 cc. $\text{C}_6\text{H}_5\text{N}$ at -10° , treated with 30 g. $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{Cl}$ and the mixt. kept 2 hrs. at 0° , give a nearly quant. yield of the $O\text{-}p\text{-tolylsulfonyl}$ deriv. (I), m. 80° . 1 (30 g.) in 230 cc. 95% EtOH, shaken 5 days at room temp., gives $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{NH}_2$ and 80% 4,5-dioxo-2-hexenal 1-(di-Et acetal) (II), AcCOCH:CHCH(OEt) , yellowish green, b. $65-6^\circ$; II reduces Fehling soln. and $\text{NH}_4\text{OH-AgNO}_3$; the freshly prepd. aq. soln. is neutral to litmus and does not react with Schiff reagent; it does not give an adduct with maleic anhydride. The corresponding 1-(di-Me acetal) (III) b. $80.5-1.5^\circ$. II (20.2 g.) in 100 cc. EtOH, reduced over 3 g. 10% Pd-C at room temp. and atm. pres- sure, gives 80% 4,5-dioxohexenal 1-(di-Et acetal) (IV), b.

$73-8^\circ$; the corresponding di-Me acetal (V) b. $78-82^\circ$. II or III (0.5 g.) in 10 cc. H_2O and 0.5 g. $\text{NH}_4\text{OH-HCl}$ in concd. aq. soln. give 4,5-dioxo-2-hexenal 1-oxime, m. 236° (decompn.); FeCl_3 gives a red color; Hydrazo , $\text{C}_{12}\text{H}_{10}\text{O}_4\text{N}_2$, m. 108° . 4,5-Dioxo-2-hexenal bis(phenylhydrazo- ne), orange-red, m. 200° (decompn.). Oxidation of III with O_2 in CHCl_3 gives $(\text{CHO})_2$; KMnO_4 gives AcOH and $(\text{CO}_2\text{H})_2$; H_2O_2 gives $(\text{CH}_2\text{CO}_2\text{H})_2$. V and Ag $_2\text{O}$ in H_2O , refluxed 1 hr., give $(\text{CH}_2\text{CO}_2\text{H})_2$. IV or V (0.5 g.) and 1 g. PhNHNH_2 in 5 cc. AcOH, heated 10 min. on the steam bath, gives 1-phenyl-3-acetyl-1,6-dihydropyridazine phenylhydrazone, pale yellow, does not m. up to 280° . V (2.5 g.) in 60 cc. 2% H_2SO_4 , refluxed 1 hr., gives $o\text{-C}_6\text{H}_4(\text{OH})_2$. Natural $o\text{-C}_6\text{H}_4(\text{OH})_2$ derivs. might be formed from carbohydrates through furan derivs.

CA. 10

Furan compounds. IV. Reactions of the *p*-tolylsulfonyl derivatives of several furyl ketoximes with alcohols. I. Nargha and F. Ganczy (Univ. "Bolyai" Rumania Cluj-Kolozsvár). *J. Am. Chem. Soc.* 72, 2738-40 (1950); cf. *C.A.* 45, 15734. The reactions with MeOH and EtOH of the *O*-*p*-MeC₆H₄SO₂ derivs. of several aliphatic and aromatic furyl ketoximes were studied, including 2-propionyl-

(I), 2-hydroxyacetyl- (II), 2-benzoyl- (III), 2-(*p*-methoxybenzoyl)furan oxime (IV), and 2-benzoylbenzofuran oxime (V). The aliphatic (*p*-tolylsulfonyl) furyl ketoximes react with alcs. by an opening of the furan ring with acetal formation and subsequent substitution of the imino group by O, as illustrated by $O:CH:CH:CH:CCMe:N(OSO_2C_6H_4Me$

(VI), and the aromatic compds. undergo a Beckmann rearrangement. V (2 g.) in 20 ml. Et₂O was shaken with 10 ml. H₂O 50 hrs. at room temp., the Et₂O layer dried and evapd., and the solid residue recrystd. from C₆H₆ by addn. of petr. ether, yielding 1.0 g. 2-acetylfuran oxime (VII), m. 89°. Also 1 g. VI was kept 7 days in a sealed tube with 5 ml. abs. EtOH, the crystals of *p*-MeC₆H₄SO₂NH₂ filtered, and washed with abs. EtOH, the filtrate evapd. *in vacuo*, and an aq. soln. of NH₄OH.HCl added to the oily residue, yielding MeCOCOCCH:CHCH:NH₂, m. 235° (from H₂O). CH₃COCl (9 g.) in 10 ml. pyridine was slowly added with stirring to 6.25 g. VII in 25 ml. CHCl₃ and 5 ml. pyridine at -10°, the mixt. kept at room temp. 30 min., the mixt. poured into ice-H₂O, and the CHCl₃ layer washed with H₂O and dried with Na₂SO₄, and evapd. *in vacuo*, yielding 54% of the *o*-trichloroacetyl deriv. (VIII), m. 98° (from C₆H₆). VIII (2 g.) did not change after 14 days in 20 ml. 95% EtOH at 35°. Likewise 5 g. *O*-H₂ deriv. of VII remained unchanged in 25 ml. 95% EtOH after boiling for

CA

10

acetal oximes. The oximes, in general, were prepd. by refluxing 0.1 mole ketone, 0.1+ mole $\text{NH}_4\text{OH} \cdot \text{HCl}$, 0.1+ mole AcONa and 80 ml. 95% EtOH 5 hrs., filtering hot from the pptd. NaCl , evapng. the filtrate *in vacuo*, and crystg. the oxime by addn. of cold H_2O . Oximes of the following ketones were so prepd. (yields and m.ps., resp.): 5-methyl-2-acetyl-furan, white plates from petr. ether, 80%, m. 78-9°; 2-propionylfuran, white needles, 82%, m. 77°; 2-(hydroxyacetyl)furan, 78%, m. 132-4°; and 2-(p-methoxybenzoyl)furan, 75%, m. 135-7°. The p-MeC₆H₄SO₃ derivs. of the oximes, in general, were prepd. by adding 0.1 mole powd. p-MeC₆H₄SO₃Cl to 0.1 mole oxime in 50 ml. pyridine at -10° with stirring, letting stand at room temp. 2 hrs., pouring the mixt. into ice water, filtering the pptd. esters, washing carefully with cold H_2O , and drying *in vacuo*. The p-toluenesulfonic esters of the following oximes were so prepd.: 5-methyl-2-acetyl-furan oxime, white needles from C₆H₆ and petr. ether, 85%, m. 111° (decompn.), remained unchanged after refluxing with 20 ml. 95% EtOH 48 hrs.; 2-propionylfuran oxime, white needles from petr. ether, 68%, m. 68°; 2-(hydroxyacetyl)furan oxime, white crystals from C₆H₆ and petr. ether, 80%, m. 84-7° (decompn.); 2-benzoylfuran oxime, 50%, m. 118° (decompn.) (from EtOH); 2-(p-methoxybenzoyl)furan oxime, white plates from C₆H₆ and petr. ether, 72%, m. 119-20°; 2-benzoylbenzofuran oxime, 50%, m. 118° (decompn.) (from EtOH). A soln. of 10 g. p-toluenesulfonic ester of 2-(hydroxyacetyl)furan oxime in 50 ml. EtOH

kept at 30° for 24 hrs., and the mixt. treated as previously described; the resulting solid was p-MeC₆H₄SO₃NH₂ (IX), the liquid was the acetal of 4,6-diketo-2-hexenal, bp 71-3° (oxime, m. 235°). A suspension of 10 g. oxime of V in 50 ml. 95% EtOH was kept at 30° for 10 days with occasional shaking, the solvent removed *in vacuo*, the residue dissolved in 25 ml. H_2O and 25 ml. H_2O , and the acidic aq. layer neutralized with NH_4OH , treated with charcoal, and evapd. to dryness; the residue was IX. The Et₂O layer was then evapd., and the residue recrystd. from EtOH with charcoal, yielding 2-furanilide, m. 124°. IV in 15 ml. 95% EtOH was refluxed 5 hrs., the residue from evapn. dissolved in Et₂O and H_2O , and neutralized with NH_4OH , yielding IX. The Et₂O soln. was evapd. and the residue recrystd. from H_2O , yielding 60% p-methoxy-2-furanilide, white needles, m. 105-6°, hydrolyzed with 2 N H_2SO_4 to 2-furoic acid and p-MeOC₆H₄NH₂. Its structure was further confirmed by synthesis from 2,6 g. furoyl chloride in 10 ml. C₆H₆ and 5 g. p-MeOC₆H₄NH₂ in 20 ml. C₆H₆ kept at room temp. 1 day, and the ppt. filtered, washed with EtOH and H_2O , and recrystd. from H_2O , giving a product m. 105-6°. V (5 g.) in 40 ml. EtOH was refluxed 4 hrs., the solvent evapd., and the residue dissolved in Et₂O and H_2O ; the H_2O solution again yielded IX after neutralization with NH_4OH and evapn.; evapn. of the Et₂O soln. and crystn. of the residue from 10% EtOH yielded 48% benzofur-carboxanilide, m. 158°.
